

iFly final project presentation

What en-route traffic demand can safely be accommodated?

iFly final project presentation Berlin, Hilton Hotel, 13th May 2011

- <u>CD&R approach</u>
- A3 ConOps modelling
- Monte Carlo simulations
- Conclusions

Medium Term CD&R approach

- Each a/c broadcasts its current 4D plan and its destination; SWIM transfers this over-the-horizon.
- Each aircraft detects conflicts (5NM/1000ft) 10 min. ahead
- a/c nearest to destination has priority over other a/c.
- a/c with lowest priority has to make its 4D plan conflict free (15 min ahead) with all other plans.
- Undershooting of 5Nm/1000ft is allowed if there is no feasible conflict free plan and it does not create a short term conflict (this way everyone keeps on moving)
- Then such aircraft broadcasts its non-conflict-free 4D plan together with a message of being "Handicapped" (which is priority increasing)

Velocity Obstacles = Collision Cones Medium Term (10 min & 5 Nm)

Velocity Obstacles = Collision Cones Medium Term (10 min & 5 Nm)

Velocity Obstacles = Collision Cones Medium Term (10 min & 5 Nm)

Short Term CD&R approach

- a/c which detects conflict is obliged to resolve the conflict without awaiting any of the other aircraft
- Course change is identified using Velocity Obstacles (3 min. ahead)
- Conflict free means 3Nm/900ft minimal predicted miss distance
- Undershooting of these values is allowed if there is no feasible alternative (this way everyone keeps on moving)
- a/c broadcasts its new course or rate of climb/descend

Velocity Obstacles = Collision Cones Short Term (3 min & 3 Nm)

- CD&R approach
- <u>A3 ConOps modelling</u>
- Monte Carlo simulations
- Conclusions

Stochastic modelling and MC simulation

- Hazard identification
- Defining the relevant Agents
- Developing Petri net for each Agent
- Connecting Agent Petri nets
- Parametrization, Verification & Calibration
- Monte Carlo simulation
- Speeding up MC simulation
- Validation

Multi Agent model

MC simulation speed up

- Simulate from one conflict level to conflict level
- A fraction of simulations reaches next level
- Multiply fractions of these simulations
- Conditions for convergence (Cerou et al., 2002)

Conflict levels in air traffic

- MTC = Medium Term Conflict
- STC = Short Term Conflict
- MSI = Minimum Separation Infringement
- LOS = Loss of Separation
- NMAC = Near Mid-Air Collision
- MAC = Mid-Air Collision

- CD&R approach
- A3 ConOps modelling
- <u>Monte Carlo simulations</u>
- Conclusions

Monte Carlo Simulation Scenarios

- Two aircraft encounter under AMFF
- Eight aircraft encounter under AMFF
- Random traffic high density under AMFF

Random Traffic Scenarios

- Periodic Boundary Condition
- Eight a/c per packed box/ no climbing or descending a/c
- Vary container size in order to simulate:
 - 2.5x as dense above Frankfurt on 23rd July '99
 - 5x as dense above Frankfurt on 23rd July '99

Random traffic

- CD&R approach
- A3 ConOps modelling
- Monte Carlo simulations
- <u>Conclusions</u>

Conclusions

- A3 ConOps with Velocity Obstacles based CD&R algorithms has very good rare event behaviour under very high en-route traffic demand
- NMAC and MAC events have not been observed during the rare event Monte Carlo simulations
- Aim is to further improve the speed-up of the simulations, and then to perform sensitivity and uncertainty analysis
- Next presentation considers flight efficiency using CD&R algorithms more advanced than Velocity Obstacles

Reporting

Completion of iFly safety analysis and corresponding reports:

- D7.3 Intermediate report on A3 ConOps safety evaluation
 This will be based on the results reported in this presentation
- D7.4 Final report on A3 ConOps safety evaluation
 This will include an initial sensitivity analysis
- D7.2g Final report on Monte Carlo speed-up
 - This will explain the techniques that have been used to accelerate the Rare Event Monte Carlo simulations
- Make these reports publicly available on the iFly web site

Questions / Discussion
