

Complexity in Air Traffic Management

S. Puechmorel, D. Delahaye and N. Dougui

ENAC

June 25, 2009

Air traffic Management Requirements

Air traffic Management Requirements

- Insure separation between aircraft.

Air traffic Management Requirements

- Insure separation between aircraft.
- Avoid costly manoeuvres and optionally optimize trajectories.

Air traffic Management Requirements

- Insure separation between aircraft.
- Avoid costly manoeuvres and optionally optimize trajectories.
- Insure traffic organization.

Air traffic Management Requirements

- Insure separation between aircraft.
- Avoid costly manoeuvres and optionally optimize trajectories.
- Insure traffic organization.

Trends

Air traffic Management Requirements

- Insure separation between aircraft.
- Avoid costly manoeuvres and optionally optimize trajectories.
- Insure traffic organization.

Trends

- Separation delegated to aircraft.

Air traffic Management Requirements

- Insure separation between aircraft.
- Avoid costly manoeuvres and optionally optimize trajectories.
- Insure traffic organization.

Trends

- Separation delegated to aircraft.
- Trajectory based air traffic management.

Air traffic Management Requirements

- Insure separation between aircraft.
- Avoid costly manoeuvres and optionally optimize trajectories.
- Insure traffic organization.

Trends

- Separation delegated to aircraft.
- Trajectory based air traffic management.
- Introduction of decision support tools / automated conflict solvers.

How hard is control task ?

Workload

How hard is control task ?

Workload

- Related to cognitive processes of human controllers.

How hard is control task ?

Workload

- Related to cognitive processes of human controllers.
- Easy/Hard forecasting of conflict occurrence.

How hard is control task ?

Workload

- Related to cognitive processes of human controllers.
- Easy/Hard forecasting of conflict occurrence.
- Monitoring is a non negligible part of the workload.

How hard is control task ?

Workload

- Related to cognitive processes of human controllers.
- Easy/Hard forecasting of conflict occurrence.
- Monitoring is a non negligible part of the workload.
- Relevant for a human-centric system.

How hard is control task ?

Workload

- Related to cognitive processes of human controllers.
- Easy/Hard forecasting of conflict occurrence.
- Monitoring is a non negligible part of the workload.
- Relevant for a human-centric system.

Complexity

How hard is control task ?

Workload

- Related to cognitive processes of human controllers.
- Easy/Hard forecasting of conflict occurrence.
- Monitoring is a non negligible part of the workload.
- Relevant for a human-centric system.

Complexity

- Related to traffic structure.

How hard is control task ?

Workload

- Related to cognitive processes of human controllers.
- Easy/Hard forecasting of conflict occurrence.
- Monitoring is a non negligible part of the workload.
- Relevant for a human-centric system.

Complexity

- Related to traffic structure.
- Measure of intrinsic disorder of a set of trajectories.

How hard is control task ?

Workload

- Related to cognitive processes of human controllers.
- Easy/Hard forecasting of conflict occurrence.
- Monitoring is a non negligible part of the workload.
- Relevant for a human-centric system.

Complexity

- Related to traffic structure.
- Measure of intrinsic disorder of a set of trajectories.
- Increases with :

How hard is control task ?

Workload

- Related to cognitive processes of human controllers.
- Easy/Hard forecasting of conflict occurrence.
- Monitoring is a non negligible part of the workload.
- Relevant for a human-centric system.

Complexity

- Related to traffic structure.
- Measure of intrinsic disorder of a set of trajectories.
- Increases with :
 - Sensitivity to uncertainties.

How hard is control task ?

Workload

- Related to cognitive processes of human controllers.
- Easy/Hard forecasting of conflict occurrence.
- Monitoring is a non negligible part of the workload.
- Relevant for a human-centric system.

Complexity

- Related to traffic structure.
- Measure of intrinsic disorder of a set of trajectories.
- Increases with :
 - Sensitivity to uncertainties.
 - interdependence of conflicts.

How hard is control task ?

Workload

- Related to cognitive processes of human controllers.
- Easy/Hard forecasting of conflict occurrence.
- Monitoring is a non negligible part of the workload.
- Relevant for a human-centric system.

Complexity

- Related to traffic structure.
- Measure of intrinsic disorder of a set of trajectories.
- Increases with :
 - Sensitivity to uncertainties.
 - interdependence of conflicts.
- Relevant in an highly automated ATM system.

Air traffic complexity uses

Airspace design

Airspace design

- Airspace comparison (US-Europe)

Airspace design

- Airspace comparison (US-Europe)
- Evaluation of Airspace Organisation Schemes

Airspace design

- Airspace comparison (US-Europe)
- Evaluation of Airspace Organisation Schemes
- Implementation of flexible use of airspace policies

Air traffic complexity uses

Airspace design

- Airspace comparison (US-Europe)
- Evaluation of Airspace Organisation Schemes
- Implementation of flexible use of airspace policies

4D contract framework

Air traffic complexity uses

Airspace design

- Airspace comparison (US-Europe)
- Evaluation of Airspace Organisation Schemes
- Implementation of flexible use of airspace policies

4D contract framework

- 4D Trajectory design.

Airspace design

- Airspace comparison (US-Europe)
- Evaluation of Airspace Organisation Schemes
- Implementation of flexible use of airspace policies

4D contract framework

- 4D Trajectory design.
- Forecasting of potentially hazardous traffic situations.

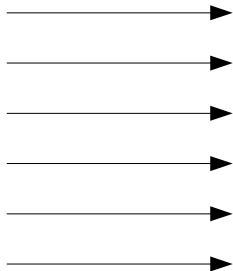

Airspace design

- Airspace comparison (US-Europe)
- Evaluation of Airspace Organisation Schemes
- Implementation of flexible use of airspace policies

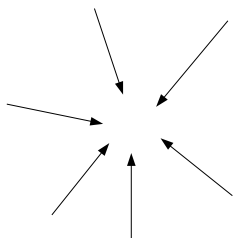

4D contract framework

- 4D Trajectory design.
- Forecasting of potentially hazardous traffic situations.
- Automated Conflict Solver enhancement (robustness of the solution).

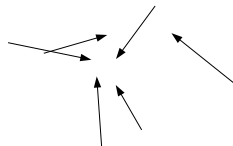

Intrinsic part of complexity

High predictability
Conflict-free

High predictability
Conflict
No induced conflicts

Low predictability
Conflict
Secondary conflicts induced

Complexity

Air Traffic Model

Air Traffic Model

- Consider aircraft as particles moving in a velocity field.

Air Traffic Model

- Consider aircraft as particles moving in a velocity field.
- Fill in the gaps by interpolating a smooth vector field.

Defining complexity

Air Traffic Model

- Consider aircraft as particles moving in a velocity field.
- Fill in the gaps by interpolating a smooth vector field.

Lyapunov exponents

Air Traffic Model

- Consider aircraft as particles moving in a velocity field.
- Fill in the gaps by interpolating a smooth vector field.

Lyapunov exponents

- Measure of sensitivity to initial conditions.

Air Traffic Model

- Consider aircraft as particles moving in a velocity field.
- Fill in the gaps by interpolating a smooth vector field.

Lyapunov exponents

- Measure of sensitivity to initial conditions.
- Related to mixing.

Air Traffic Model

- Consider aircraft as particles moving in a velocity field.
- Fill in the gaps by interpolating a smooth vector field.

Lyapunov exponents

- Measure of sensitivity to initial conditions.
- Related to mixing.
- A complexity map is produced.

Air Traffic Model

- Consider aircraft as particles moving in a velocity field.
- Fill in the gaps by interpolating a smooth vector field.

Lyapunov exponents

- Measure of sensitivity to initial conditions.
- Related to mixing.
- A complexity map is produced.
- A relation exists with the minimal amount of information needed to organize the traffic

Problem statement

Problem statement

- Find a smooth enough vector field interpolating the aircraft velocities at measurement points.

Problem statement

- Find a smooth enough vector field interpolating the aircraft velocities at measurement points.
- Insure that interpolating field is relevant for ATM.

Problem statement

- Find a smooth enough vector field interpolating the aircraft velocities at measurement points.
- Insure that interpolating field is relevant for ATM.

Interpolation criterion

Problem statement

- Find a smooth enough vector field interpolating the aircraft velocities at measurement points.
- Insure that interpolating field is relevant for ATM.

Interpolation criterion

- Let $(t_i, x_i, v_i)_{i=1\dots N}$ be the measured positions and velocities at given times.

Problem statement

- Find a smooth enough vector field interpolating the aircraft velocities at measurement points.
- Insure that interpolating field is relevant for ATM.

Interpolation criterion

- Let $(t_i, x_i, v_i)_{i=1\dots N}$ be the measured positions and velocities at given times.
- The interpolating field X must satisfy : $X(t_i, x_i) = v_i, i = 1 \dots N$.

Operational requirements

Operational requirements

- Velocity at a given point has to be close to the mean velocities of its neighbors (coherence).

Operational requirements

- Velocity at a given point has to be close to the mean velocities of its neighbors (coherence).
- Velocity at a given point must change slowly.

Operational requirements

- Velocity at a given point has to be close to the mean velocities of its neighbors (coherence).
- Velocity at a given point must change slowly.

Functional criterion

$$\int \int \|\Delta X(x, t)\|^2 + \mu \left\| \frac{\partial X}{\partial t}(x, t) \right\|^2 dx dt$$

where μ controls the relative importance of both smoothness requirements.

Interpolating spline

Original problem

Original problem

- Solution is a sum of singular radial basis kernels :

$$p(t, x) = \frac{1}{\|x\|} \mathbf{erf} \left(\mu^{1/4} \frac{\|x\|}{2\sqrt{|t|}} \right)$$

Original problem

- Solution is a sum of singular radial basis kernels :

$$p(t, x) = \frac{1}{\|x\|} \mathbf{erf} \left(\mu^{1/4} \frac{\|x\|}{2\sqrt{|t|}} \right)$$

Modified problem

Original problem

- Solution is a sum of singular radial basis kernels :

$$p(t, x) = \frac{1}{\|x\|} \operatorname{erf} \left(\mu^{1/4} \frac{\|x\|}{2\sqrt{|t|}} \right)$$

Modified problem

- Interpolation condition is relaxed :

$$\frac{1}{(2\pi\sigma)^{3/2}} \int_{\mathbb{R}^3} e^{-\frac{\|x-x_j\|^2}{2\sigma^2}} X(t, x) dx = v_j$$

Interpolating spline

Modified problem solution

Modified problem solution

- Solution is a sum of radial basis kernels :

$$p(t, x) = \frac{\sigma}{\|x\|} \operatorname{erf} \left(\frac{\mu^{1/4} \|x\|}{\sigma \sqrt{2 + |t|}} \right)$$

Modified problem solution

- Solution is a sum of radial basis kernels :

$$p(t, x) = \frac{\sigma}{\|x\|} \operatorname{erf} \left(\frac{\mu^{1/4} \|x\|}{\sigma \sqrt{2 + |t|}} \right)$$

- Optimal interpolating field is :

$$X(t, x) = \sum_{i=1}^N \lambda_i p(t - t_i, x - x_i) + Ax + b$$

with $\lambda_i, b \in \mathbb{R}^3$ and A a 3×3 matrix.

Modified problem solution

- Solution is a sum of radial basis kernels :

$$p(t, x) = \frac{\sigma}{\|x\|} \operatorname{erf} \left(\frac{\mu^{1/4} \|x\|}{\sigma \sqrt{2 + |t|}} \right)$$

- Optimal interpolating field is :

$$X(t, x) = \sum_{i=1}^N \lambda_i p(t - t_i, x - x_i) + Ax + b$$

with $\lambda_i, b \in \mathbb{R}^3$ and A a 3×3 matrix.

- Coefficients λ_i, A, b are obtained by solving a linear system.

Example

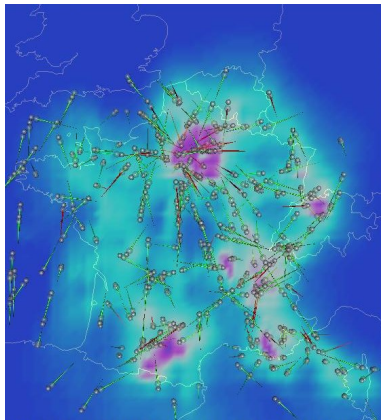

Figure: Complexity map produced over France

Achievements

Achievements

- Definition of an intrinsic air traffic complexity.

Achievements

- Definition of an intrinsic air traffic complexity.
- Fits within the framework of major projects SESAR/NETGEN.

Achievements

- Definition of an intrinsic air traffic complexity.
- Fits within the framework of major projects SESAR/NETGEN.
- Identifies complexity hot spots.
